

**PENNSYLVANIA GAME COMMISSION
BUREAU OF WILDLIFE MANAGEMENT
RESEARCH DIVISION
ANNUAL PROJECT REPORT**

PROJECT CODE NO.: 06110

TITLE: Survey and Statistical Support Section

PROJECT JOB NO.: 11101

TITLE: Game Take and Furtaker Surveys

PERIOD COVERED: 1 July 2001 to 30 June 2002

COOPERATING AGENCIES: Bureau of Automated Technology Services (BATS), Bureau of Administrative Services

WORK LOCATION(S): Harrisburg, Pennsylvania

PREPARED BY: Christopher S. Rosenberry

DATE: 24 July 2002

Abstract: A questionnaire was mailed to a random sample of purchasers of a 2001-2002 general hunting license (20,101 questionnaires mailed) to estimate number of hunters, harvest, and hunter-days of small game species during the 2001-2002 hunting season. After 3 mailings, 58.6% responded. Overall, between 2000-2001 and 2001-2002 hunting seasons, harvests remained similar and hunter numbers increased slightly. Nineteen-year trends in harvest and hunter participation indicate a continued decline for nearly all small game species. A separate questionnaire was mailed to a random sample of purchasers of a furtaker license (2,233 mailed) to estimate harvest of furbearer species and trapper-days. After 2 mailings, 71.6% responded. Overall, the harvest of furbearer species and the number of hunters/trappers increased between the 2000-2001 and 2001-2002 seasons. Nineteen-year trends for harvests of furbearers indicate harvests have declined dramatically for most species. Junior and senior combination license holders are not included in the furtaker sample, thus some furtakers are not included in survey estimates. None of the harvest estimates in this report have been adjusted to account for combination license holders. Therefore, corrected estimates from the 1999-2000 and 2000-2001 in previous reports will not correspond to the estimates in this report.

OBJECTIVES

1. To estimate the number of animals harvested, number of participants, and number of days spent hunting (hunter-days) for small game species during the 2001-2002 hunting season.
2. To estimate the number of furbearers trapped or shot and number of trappers/hunters during the 2001-2002 furbearer seasons.
3. To monitor long-term trends in harvest, number of hunters and trappers, hunter-days, and harvest per 100 hunter-days.

PROCEDURES

In March 2002, following the close of trapping and small game hunting

seasons, the names and addresses of general hunting license buyers whose license number ended in either 01 or 51, and furtakers whose license number ended in either 1 or 6, were drawn from the duplicate licenses on file in the License Division of the Bureau of Administrative Services and from the electronic file of over the counter (OTC) sales. Photocopies of the duplicates and the OTC file were used by BATS to prepare the mailing list. BATS and Bureau of Administrative Services addressed and mailed 20,101 Game Take questionnaires and 2,233 Furtaker questionnaires. In addition to the initial mailing, 2 follow-up mailings were sent to nonrespondents of the Game Take Survey and 1 follow-up mailing was sent to nonrespondents of the Furtaker Survey.

These surveys reflect major changes from pre-1990 surveys of information requested from hunters and trappers. First, information about small game and furbearer species were separated into Game Take and Furtaker Surveys, respectively. Second, the Game Take questionnaire was expanded to include more harvestable species and the number of days of hunting per species per county. Third, harvest and hunting effort on shooting preserves were requested separately for ring-necked pheasant, quail, and ducks. Fourth, estimates of coyote harvest included those shot by hunters (Game Take Survey excluding furtaker license buyers) and those trapped or shot by furtakers (Furtaker Survey). Fifth, a cover letter to encourage response was included in all mailings.

During 1990-2000, methods used to survey small-game hunters and furtakers have been the same with the following exceptions. The Game Take Survey for 1992 consisted of 2/3 the usual sample size (i.e., every third 01 or 51 license was skipped) and only 2 mailings were conducted, but a telephone survey of nonrespondents was conducted to estimate nonresponse bias. Estimates using the standard estimation techniques (Shope 1985) were similar to those obtained when incorporating nonresponse bias (Diefenbach 1993). Therefore, estimates from the 1992 survey should be comparable to results from other years. In 1996 hunters were asked to report their Canada goose harvest by season (early, regular, late), and their snow goose harvest. This change was implemented to assess the effect of special goose seasons since the regular season was closed for most of the state, and to compare our estimates to those obtained by the newly implemented Migratory Bird Harvest Information Program. Since 1998 Game Take Survey turkey hunters were to report the management unit in which they hunted instead of the county. In 2000, landowner, resident senior lifetime upgrades, and resident senior lifetime renewals were included in the total licenses sold for calculating harvests and participation. This resulted in the addition of licenses to our survey population that otherwise would not have been included. The added senior licenses have existed since 1996 for lifetime renewals and 1999 for lifetime upgrades. Therefore, estimates of Game Take Surveys from 1996-1999 likely underestimate harvest by about 2-3%. Landowner licenses represent less than 0.5% of license sales and would have had minimal effect on previous survey estimates.

Since 1999, Furtaker Surveys sampled those who purchased a furtaker license but not those who purchased junior and senior combination licenses, which include furtaker privileges. As a result of this licensing change, furtaker harvest and participation estimates beginning in 1999 are biased low compared to pre-1999 estimates. To reduce this bias, a correction factor was used to adjust harvest and participation estimates in 1999 and 2000 Furtaker Surveys (Rosenberry 2000). The purpose of this correction was to serve as a temporary measure until a computerized licensing system was available to more accurately survey furtakers. However, no plans have developed to implement a computerized licensing system. The correction factor was based on the relationship between harvest and hunter participation of junior and senior furtakers and adult furtakers prior to 1999. As years pass, changes in the relationship between junior and senior furtakers and adult furtakers are possible, but not quantifiable. Therefore, the correction factor has been eliminated and furtaker harvest estimates since 1999 are minimum estimates that do not account for junior and senior combination licenses.

Respondents to the Game Take Survey were post-stratified on the basis of whether or not they had purchased special licenses or stamps, to reduce the effect of nonresponse bias on estimates (see Shope 1985). In 2001, combination license holders were added to those purchasing additional stamps. Response rates for combination license holders were calculated by identifying combination license holders based on license stamps letters from the survey file and their response or nonresponse to the survey. Nonresponse bias for the Furtaker Survey was not corrected.

I estimated (by species) total harvest, number of participants, hunter-days, and harvest per 100 hunter-days based on 1,044,766 general hunting licenses sold for the Game Take Survey, and 19,410 furtaker licenses sold for the Furtaker Survey. I estimated trends over time using Pearson product-moment correlation coefficients.

In addition to the harvest and participation estimates, bobcat and fisher sightings by archery and firearms deer hunters and spring turkey hunters were added to monitor distribution and range of these species. These results are presented in furtaker and bobcat population and management reports. Nine questions were also added to assess hunter support for a number of proposals.

FINDINGS

For the Game Take and Furtaker Survey respectively, 11,221 and 1,553 useable, returned questionnaires were processed. The response rates, after adjusting for undeliverable questionnaires, were 58.6% for the Game Take Survey and 71.6% for the Furtaker Survey. The response rate for the Game Take survey decreased 2.6% and Furtaker survey remained the same between 2000-2001 and 2001-2002.

During 2001-2002, an estimated 3,336 hunters harvested an estimated 6,449 snow geese during 13,166 hunter-days. This represents a decrease in harvests and harvest rates from the 1999-2000 season, when 4,128 hunters harvested 31,942 snow geese during 25,340 hunting days.

Annual Changes

Harvests of 7 of 12 small game species increased or remained the same (Table 1). The number of hunters increased for 8 of 12 small game species and hunter-days increased for 9 of 12 small game species (Tables 2 and 3). Turkey harvests and hunter-days increased, and hunters remained similar for both the spring and fall seasons.

Harvest per 100 hunter-days decreased for 8 of 12 small game species (Table 4).

The number of hunters/trappers of furbearers increased for all species (Table 5). Harvests increased for all species (Table 6).

Nineteen-year Trends

Harvests have declined ($P < 0.10$) for all species except turkey, geese, and ducks ($P < 0.10$), although the trends for crow ($P = 0.14$) and quail ($P = 0.53$) were not significant (Table 1). Number of hunters has declined for all seasons/species ($P < 0.10$) except spring turkey and ducks (Table 2).

Number of hunters/trappers of nearly all furbearer species has remained stable since 1990, although the number of hunter/trappers pursuing raccoons has declined ($r = -0.792$, $P < 0.01$) since 1983. The number of hunters and trappers pursuing coyotes continues to increase ($r = 0.975$, $P < 0.01$) (Table 5). The

harvest of all furbearers for which we have 1983-2000 data has declined ($P < 0.10$). Since 1990, coyote harvests have increased ($r = 0.937$, $P < 0.01$) and weasel harvest have varied with no consistent change ($P = 0.93$).

Survey Questions

Nine questions on various topics asked respondents to record their level of support from strongly support to strongly against. Results that are weighted for purchasers and nonpurchasers are presented in Table 7. The sampling error for these questions is a maximum of plus or minus 0.9%.

RECOMMENDATIONS

1. The Game Take and Furtaker Surveys are the best source for harvest and participant data; thus, I recommend continuing this survey.

2. Inability to sample sufficient number of combination licenses holders reduces reliability of furtaker estimates, and the correction method was a stopgap measure and not a long-term substitute for appropriate sampling methods. Rather than continue use of the correction factor, it was eliminated this year. Therefore, all furtaker harvests since 1999 are biased low. A computerized license database would increase our ability to improve our sampling of furtakers.

3. If the response rate for the Furtaker Survey becomes $<70\%$ I recommend conducting a third mailing.

4. The response rate for the Game Take Survey dropped below 60% this year. I recommend an evaluation of the survey instrument to identify options to improve the response rate.

5. Major changes to the Game Take and Furtaker Surveys should only be instituted when more efficient sampling of license buyers is possible. When the Game Commission implements a computerized licensing system, samples that are stratified by license type and location of residence will provide more accurate and precise harvest estimates. When such a system is implemented, phone calls to obtain estimates of harvest and hunting effort of nonrespondents to the mail survey may be useful. A computerized licensing system would allow us to survey hunters much sooner after hunting seasons ended, which has been shown to result in more accurate estimates of harvest and hunter participation (e.g., Barker 1991). Moreover, a computerized license system would provide greater flexibility in adapting sampling methods to future licensing changes that may reduce the reliability of estimates.

^aNo data are available prior to 1990.

^bCombines estimates from the Game Take and Furtaker surveys.

^cPearson product-moment correlation coefficient.

^dCautionary note: Estimates are minimum estimates that do not account for combination licenses.

Table 7. Responses to opinion questions, 2001-2002 Game Take Survey.

Question	Strongly Support	Support	Undecided	Against	Strongly Against
1. Opening small game seasons for rabbits and pheasants with squirrels and grouse rather than 2 weeks later.	29%	34%	19%	11%	8%
2. Either sex pheasant hunting on all State Game Lands.	22%	28%	23%	16%	11%
3. Closing bobwhite quail hunting season statewide.	19%	17%	52%	7%	5%
4. Making crossbows legal during all firearm deer seasons.	15%	17%	16%	19%	33%
5. A rifle season in October for antlerless deer for all hunters.	20%	19%	11%	18%	32%
6. An antler restriction of at least 3 points to one antler.	24%	21%	12%	16%	27%
7. An archery season for bears during a portion of the deer archery season.	14%	24%	28%	14%	19%
8. Sunday hunting for groundhogs.	34%	27%	13%	10%	16%
9. Giving one bull elk license per year to a conservation organization for auction or raffle with proceeds used for elk management.	26%	33%	21%	7%	12%
