# PENNSYLVANIA GAME COMMISSION BUREAU OF WILDLIFE MANAGEMENT <br> RESEARCH DIVISION ANNUAL PROJECT REPORT 

PROJECT CODE NO.: 06110
TITLE: Survey and Statistical Support
PROJECT JOB NO.: 11101
TITLE: Game Take and Furtaker Surveys
PERIOD COVERED: 1 July 2005 to 30 June 2006
COOPERATING AGENCIES: Bureau of Automated Technology Services (BATS), Bureau of
Administrative Services
WORK LOCATION(S): Harrisburg, Pennsylvania
PREPARED BY: Tracey M. Librandi Mumma
DATE: 9 August 2006

#### Abstract

A questionnaire was mailed to a random sample of purchasers of a 200506 general hunting license ( 18,921 questionnaires mailed) to estimate number of hunters, harvest, and hunter-days of small game species during the 2005-06 hunting season. After 3 mailings, 53.9\% responded. Overall, between 2003-04 and 2005-06 hunting seasons, harvests, and hunter numbers decreased. Twenty-three year trends in harvest and hunter participation indicate a decline for nearly all small game species. A separate questionnaire was mailed to a random sample of purchasers of a furtaker license (3,656 mailed) to estimate harvest of furbearer species and trapper-days. After 2 mailings, $67.8 \%$ responded. Overall, the harvest of furbearer species and the number of hunters/trappers increased between the 2003-04 and 2005-06 seasons. Twenty-three year trends for harvests of furbearers indicate harvests have declined dramatically for most species. Junior and senior combination license holders are not included in the furtaker sample, thus some furtakers are not included in survey estimates. None of the harvest estimates in this report have been adjusted to account for combination license holders. Therefore, corrected estimates from 1999-2000 and 2000-01 in previous reports will not correspond to the estimates in this report. There are no data for the 2004-05 season because both surveys were not conducted due to budget cuts.

## OBJECTIVES

1. To estimate the number of animals harvested, number of participants, and number of days spent hunting (hunter-days) for small game species during the 2005-2006 hunting season.
2. To estimate the number of furbearers trapped or shot and number of trappers/hunters during the 2005-06 furbearer seasons.
3. To monitor long-term trends in harvest, number of hunters and trappers, hunter-days, and harvest per 100 hunter-days.

## METHODS

In March 2006, following the close of trapping and small game hunting seasons, the names and addresses of general hunting license buyers whose license number ended in either 01 or 51, and furtakers whose license number ended in either 1 or 6, were drawn from the duplicate licenses on file in the License Division of the Bureau of Administrative Services and from the electronic file of over the counter (OTC) sales. Photocopies of the duplicates and the OTC file were used by BATS to prepare the mailing list. BATS and Bureau of Administrative Services addressed and mailed 18,921 Game Take questionnaires and 3, 656 Furtaker questionnaires. In addition to the initial mailing, 2 follow-up mailings were sent to nonrespondents of the Game Take Survey, and 1 follow-up mailing was sent to nonrespondents of the Furtaker Survey.

These surveys reflect major changes of information requested from hunters and trappers from pre-1990 surveys. First, information about small game and furbearer species were separated into Game Take and Furtaker Surveys, respectively. Second, the Game Take questionnaire was expanded to include more harvestable species and the number of days of hunting per species per WMU. Third, harvest and hunting effort on shooting preserves were requested separately for ring-necked pheasant, quail, and ducks. Fourth, estimates of coyote harvest included those shot by hunters (Game Take Survey excluding furtaker license buyers) and those trapped or shot by furtakers (Furtaker Survey). Fifth, a cover letter to encourage response was included in all mailings.

During 1990-2000, methods used to survey small game hunters and furtakers have been the same with the following exceptions. The Game Take Survey for 1992 consisted of $2 / 3$ the usual sample size (i.e., every third 01 or 51 license was skipped) and only 2 mailings were conducted, but a telephone survey of nonrespondents was conducted to estimate nonresponse bias. Estimates using the standard estimation techniques (Shope 1985) were similar to those obtained when incorporating nonresponse bias (Diefenbach 1993). Therefore, estimates from the 1992 survey should be comparable to results from other years. In 1996 hunters were asked to report their Canada goose harvest by season (early, regular, late), and their snow goose harvest. This change was implemented to assess the effect of special goose seasons since the regular season was closed for most of the state, and to compare our estimates to those obtained by the newly implemented Migratory Bird Harvest Information Program. Since 1998 Game Take Survey turkey hunters were to report the management unit in which they hunted instead of the county. In 2000, landowner, resident senior lifetime upgrades, and resident senior lifetime renewals were included in the total licenses sold for calculating harvests and participation. This resulted in the addition of licenses to our survey population that otherwise would not have been included. The added senior licenses have existed since 1996 for lifetime renewals and 1999 for lifetime upgrades. Therefore, estimates of Game Take Surveys from 1996-99 likely underestimate harvest by about 2-3\%. Landowner licenses represent less than $0.5 \%$ of license sales and would have had minimal effect on previous survey estimates.

Since 1999, Furtaker Surveys sampled those who purchased a furtaker license but not those who purchased junior and senior combination licenses, which include furtaker privileges. As a result of this licensing change, furtaker harvest and participation estimates beginning in 1999 are biased low compared to pre-1999 estimates. To reduce this bias, a correction factor was used to adjust harvest and participation estimates in 1999 and 2000 Furtaker Surveys (Rosenberry 2000); however, this correction was discontinued in 2001 (Rosenberry 2001) and furtaker harvest estimates since 1999 are minimum estimates that do not include junior and senior combination licenses.

Beginning in 2003-04, respondents reported harvests by Wildlife Management Units (WMUs) rather than counties. In addition, the survey form was simplified by reducing the number of possible hunting areas from 4 counties to 2 WMUs. This was done because less than $5 \%$ of hunters hunted in the $3^{\text {rd }}$ or $4^{\text {th }}$ county on previous surveys and there are fewer WMUs ( 22 WMUs vs. 67 counties).

Beginning in 2005-06, respondents reported Canada goose and duck harvest by Canada goose and duck zone respectively. This change was implemented because Canada goose and duck populations are harvested and managed by zone, not WMUs. Respondents also reported dove harvest by seasons (early, mid, and late) instead of just the total harvest.

Respondents to the Game Take Survey were post-stratified on the basis of whether or not they had purchased special licenses or stamps, to reduce the effect of nonresponse bias on estimates (see Shope 1985). In 2001, combination license holders were added to those purchasing additional stamps. Response rates for combination license holders were calculated by identifying combination license holders based on license stamps letters from the survey file and their response or nonresponse to the survey. Nonresponse bias for the Furtaker Survey was not corrected.

I estimated (by species) total harvest, number of participants, hunterdays, and harvest per 100 hunter-days based on 959,093 general hunting licenses sold for the Game Take Survey, and 23,941 furtaker licenses sold for the Furtaker Survey. I estimated trends over time using Pearson product-moment correlation coefficients.

In addition to the harvest and participation estimates, bobcat and fisher sightings by archery and firearms deer hunters and spring turkey hunters were added in 2001-02 to the Game Take Survey, to monitor distribution and range of these species. In 2005-06, bobcat and fisher sightings by bear hunters during the regular season were also added. These results are presented in furtaker and bobcat population and management reports.

On the 2005-06 Game Take Survey, 4 questions were included to assess hunter support for a number of proposals and 3 questions to assess junior hunter participation in the youth waterfowl hunt, youth spring gobbler hunt, and youth pheasant hunt. Participation in the youth junior pheasant hunt was assessed in the 2003-04 Game Take Survey. Only junior resident hunter participation is assessed because there is currently no way to distinguish between non-resident junior, adult, and senior licenses. The percent of junior resident hunters participating was calculated by taking the number of resident junior hunters who responded yes to the youth hunt questions and dividing by the number of juniors who responded. Youth waterfowl hunters were also asked to report how many ducks and geese they harvested.

## RESULTS

For the Game Take and Furtaker Surveys, 9,740 and 2,412 useable returned questionnaires were processed, respectively. The response rates, after adjusting for undeliverable questionnaires, were $53.9 \%$ for the Game Take Survey and $67.8 \%$ for the Furtaker Survey. The response rate for the Game Take survey remained stable, and the response rate for the Furtaker survey decreased by $2.5 \%$ between 2003-04 and 2005-06.

## Annual Changes

Harvests of 11 of 12 small game species decreased (Table 1). The number of hunters decreased for all 12 small game species and hunter-days decreased for 11 of 12 small game species (Tables 2 and 3). Spring turkey hunters slightly increased whereas spring turkey harvest and hunter-days decreased. Fall turkey harvest, hunter-days, and hunters all decreased.

Harvest per 100 hunter-days increased for 5 of 12 small game species (Table $4)$.

The number of hunters/trappers of furbearers increased for all 9 species (Table 5). Harvests increased for 8 of 9 species (Table 6).

## Twenty-one Year Trends

Harvests have declined ( $P$ 0.05) for nearly all species except turkey, geese, and ducks. Trends for quail ( $P=0.28$ ) were not significant (Table 1). Number of hunters has declined for nearly all seasons/species ( $P$ < 0.01) except spring turkey, quail, and ducks (Table 2).

Number of hunters/trappers of nearly all furbearer species has remained stable since 1990, although the number of hunter/trappers pursuing raccoons has declined $(P<0.01)$ since 1983. The number of hunters and trappers pursuing coyotes continues to increase $(P<0.01)$ (Table 5). The harvest of all furbearers for which we have 1983-2005 data has declined ( $P \leq 0.01$ ). Since 1990, coyote harvests have increased ( $P<0.01$ ) and weasel harvest have varied with no consistent change ( $P=0.51$ ) (Table 6).

## Survey Questions

Four questions on various topics asked respondents to record their level of support from strongly support to strongly against. Results are presented in Table 7. The sampling error for these questions is a maximum of $\pm 1 \%$.

Three questions were asked to assess resident junior hunters participation in the Youth Waterfowl Hunt, Youth Spring Gobbler Hunt, and Youth Pheasant Hunt. Results were as follows: $3 \%$ of junior hunters indicated that they participated in the youth waterfowl hunt, $21 \%$ in the youth spring gobbler hunt, and $9 \%$ in the youth pheasant hunt (down from $12 \%$ in 2003 ). Of the 18 resident junior hunters surveyed who hunted during the Youth Waterfowl Hunt, 5 were successful and harvested a total of 14 ducks and 0 geese.

## RECOMMENDATIONS

1. The Game Take and Furtaker Surveys are the best source for harvest and participant data; thus, I recommend continuing these surveys.
2. Inability to sample sufficient number of combination licenses holders reduces reliability of furtaker estimates. A computerized license database would increase our ability to improve our sampling of furtakers. Point Of Sale (POS) should be in effect for the 2007-08 hunting season and thus will increase our ability to improve our sampling of hunters.
3. I recommend conducting a third mailing for 2006-07, because the response rate for the Furtaker Survey has dropped below 70\%.
4. Continue to evaluate the survey instrument and methodologies to improve response rate.
5. Major changes to the Game Take and Furtaker Surveys will need to be addressed before the POS system goes into effect for the 2007-08 hunting and trapping season. This computerized licensing system will allow samples to be stratified by license type and location of residence will provide more accurate and precise harvest estimates. This system will allow us to survey hunters much sooner after hunting seasons end, which has been shown to result in more accurate estimates of harvest and hunter participation (e.g., Barker 1991). Moreover, a computerized license system will provide greater flexibility in adapting sampling methods to future licensing changes that may reduce the reliability of estimates.

${ }^{\text {a }}$ No data are available prior to 1990
b Combines estimates from the Game Take and Furtaker surveys.
c Cautionary note: Estimates are minimum estimates that do not account for combination licenses.
d Pearson product-moment correlation coefficient.

Table 7. Responses to opinion questions, 2005-2006 Game Take Survey.

|  | Strongly <br> Support | Support | Undecided | Against | Strongly <br> Against |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Question <br> 1. Permit regulated baiting <br> for deer hunting statewide. | $7 \%$ | $9 \%$ | $13 \%$ | $21 \%$ | $50 \%$ |
| 2. Permit regulated baiting <br> for deer hunting only in urban | $13 \%$ | $24 \%$ | $19 \%$ | $14 \%$ | $30 \%$ |
| areas, to enhance hunter <br> success by drawing deer to | 13 |  |  |  |  |
| huntable areas. |  |  |  |  |  |
| 3. Allow all licensed hunters <br> (resident and non-resident) to | $12 \%$ | $11 \%$ | $11 \%$ | $19 \%$ | $47 \%$ |
| apply for doe licenses at the <br> same time. |  |  |  |  |  |
| 4. Use citizen advisory <br> committees in each wMU to <br> offer deer management | $30 \%$ | $35 \%$ | $23 \%$ | $5 \%$ | $7 \%$ |
| recommendations. |  |  |  |  |  |

[^0]:    Estimates exclude harvest on shooting preserves
    ${ }^{b}$ Pearson product-moment correlation coefficient.

[^1]:    a Estimates exclude number of hunters on shooting preserves.
    ${ }^{\text {b }}$ Cautionary note: these low values may have been caused by inadvertently not including the TMA map on the $1998-1999$ survey instructions. See 1998-1999 annual report
    ${ }^{c}$ Pearson product-moment correlation coefficient.

[^2]:    a Estimates exclude effort on shooting preserves.
    ${ }^{b}$ Cautionary note: these low values may have been caused by inadvertently not including the TMA map on the $1998-1999$ survey instructions. See 1998-1999 annual report.

[^3]:    ${ }^{\text {a }}$ Estimates exclude effort on shooting preserves.
    b Pearson product-moment correlation coefficient.
